

ReFlex®

Protective Cushions

The **ReFlex®** technology is an innovative and highly effective approach to the cushioning of fragile equipment. This system uses vacuum-formed cushions to replace traditional flexible foams and is designed to protect your product from dynamic impact and consistently re-bound to its original shape.

ReFlex® Packaging offers OEM's excellent product protection, with a substantial cost savings. Finally, the packaging industry has a viable solution to the problems associated with foam packaging.

Performance/Memory

ReFlex® cushions have been tested on products ranging from 10 ounces to 75 lbs. and have consistently exceeded ISTA drop specifications. These tests have been performed at Lansmont, SJSU, Intel, IBM, Maxtor, HP, and many other equipment manufacturers. **ReFlex®** cushions have excellent memory, and do not fracture or particulate during testing.

Price

ReFlex® is competitively priced well below the cost of PP, PE and PU foams. The combination of lower packaging cost, faster pack out times, and saved warehouse space, make **ReFlex®** the best packaging solution which no other product can compete with.

Storage

ReFlex® stack! This feature can reduce warehouse space requirements by up to 85%. A single pallet can fit cushions for 2,400 hard drives or 250 personal computers.

Environmental

Manufactured from 100% recycled PE content, **ReFlex®** cushions are environmentally preferred to foam packaging. They are also 100% recyclable and reusable.

Tooling

ReFlex® prototype and production molds are manufactured in-house using Fadal CNC machines. Molds are cut from solid aluminum billet in order to maximize production efficiency and mold life. Keeping all engineering and machining operations "under one roof" has enabled **ReFlex®** to maximize the efficiency of this process, and deliver **QUALITY** tooling **FAST!** Each production mold built by **ReFlex®** is guaranteed to last for a minimum of 5 million parts.
